

## **AMENDMENTS TO THE CLAIMS**

1. (Currently amended) An extensible method for simplifying input provided to a computer program comprising:

~~creating receiving~~ a framework for a first grammar level;

performing a first transformation of said framework to generate a first set of rules relating to interpretation of said first grammar level, ~~wherein the first set of rules are based on a schema of the framework defined for the first grammar level;~~

performing a second transformation of said framework to generate a first presentation style for said first grammar level;

obtaining a user defined input in said first grammar, said user defined input conforming to said first set of rules ~~and said framework~~; and

applying said first set of rules and said first presentation style to said user defined input to generate an output in a second grammar ~~level conforming to document rules of an application parser understood by an application's parser.~~

2. (Currently amended) The method of claim 1, wherein said creating a framework comprises:

creating one or more files having grammar definitions conforming to a second set of rules; and

transforming said one or more files into said framework using a second presentation style conforming to said framework .

3. (Original) The method of claim 1, wherein said first transformation is in accordance with a third presentation style.

4. (Original) The method of claim 1, wherein said second transformation is in accordance with a fourth presentation style.

5. (Original) The method of claim 1, wherein said first grammar of said user defined input is extensible.

6. (Original) The method of claim 1, wherein said second grammar understood by said application's parser is fixed.

7. (Original) The method of claim 1, wherein said data representation language is extensible markup language (XML).

8. (Currently amended) A computer readable product comprising:  
a computer readable medium having a computer readable product comprising a computer readable document embodied therein, said computer readable document utilized for input into a rule engine, said computer readable document created by performing a method comprising:  
~~creating receiving~~ a framework for a first grammar level;  
performing a first transformation of said framework to generate a first set of rules relating to interpretation of said first grammar level, wherein the first set of rules are based on a schema of the framework defined for the first grammar level;  
performing a second transformation of said framework to generate a first presentation style for said first grammar level;  
obtaining a user defined input in said first grammar, said user defined input conforming to said first set of rules and said framework; and  
applying said first set of rules and said first presentation style to said user defined input to generate an output in said document, said output conforming to a second grammar level conforming to document rules of an application parser understood by an application's parser.

9. (Currently amended) The computer readable product of claim 8, wherein said creating a framework comprises:

creating one or more files having grammar definitions conforming to a second set of rules; and  
transforming said one or more files into said framework using a second presentation style conforming to said framework .

10. (Original) The computer readable product of claim 8, wherein said first transformation is in accordance with a third presentation style.

11. (Original) The computer readable product of claim 8, wherein said second transformation is in accordance with a fourth presentation style.

12. (Original) The computer readable product of claim 8, wherein said first grammar of said user defined input is extensible.

13. (Original) The computer readable product of claim 8, wherein said second grammar understood by said application's parser is fixed.

14. (Original) The computer readable product of claim 8, wherein said data representation language is extensible markup language (XML).

15. (Currently amended) A computer program product comprising:  
a computer readable medium having computer program code for extensibly simplifying  
input provided to a computer program embodied therein, said computer program  
code configured to cause a computer to:  
create receive a framework for a first grammar level, wherein said framework  
comprises a schema;  
perform a first transformation of said framework to generate a first set of rules  
relating to interpretation of said first grammar level, wherein the first set  
of rules are based on a schema of the framework defined for the first  
grammar level;  
perform a second transformation of said framework to generate a first  
presentation style for said first grammar level;  
obtain a user defined input in said first grammar, said user defined input  
conforming to said first set of rules and said framework; and  
apply said first set of rules and said first presentation style to said user defined  
input to generate an output in said document, said output conforming to a  
second grammar level conforming to document rules of an application  
parser understood by an application's parser.

16. (Currently amended) The computer program product of claim 15, wherein said create a framework comprises:

creating one or more files having grammar definitions conforming to a second set of rules; and

transforming said one or more files into said framework using a second presentation style conforming to said framework .

17. (Original) The computer program product of claim 15, wherein said first transformation is in accordance with a third presentation style.

18. (Original) The computer program product of claim 15, wherein said second transformation is in accordance with a fourth presentation style.

19. (Original) The computer program product of claim 15, wherein said first grammar of said user defined input is extensible.

20. (Previously Presented) The computer program product of claim 15, wherein said second grammar understood by said application's parser is fixed.

21. (Original) The computer program product of claim 15, wherein said data representation language is extensible markup language (XML).

22. (Currently amended) An extensible method for simplifying input requirements for user input provided to a computer program comprising:

~~creating receiving~~ a schema for a first grammar level;

performing a first transformation of said schema to generate a first set of rules relating to interpretation of said first grammar level;

performing a second transformation of said schema to generate a first presentation style for said first grammar level;

obtaining a user defined input in said first grammar level, said user defined input conforming to said first set of rules and said schema; and

applying said first set of rules and said first presentation style to said user defined input to generate an output in a second grammar conforming to document rules of an application parser understood by an application's parser.

23. (Original) The method of claim 22, wherein said creating a schema comprises:

creating one or more files having grammar definitions conforming to a second set of rules; and

transforming said one or more files into said schema using a second presentation style conforming to said schema.

24. (Original) The method of claim 22, wherein said first transformation is in accordance with a third presentation style.

25. (Original) The method of claim 22, wherein said second transformation is in accordance with a fourth presentation style.

26. (Original) The method of claim 22, wherein said first grammar of said user defined input is extensible.

27. (Original) The method of claim 22, wherein said second grammar understood by said application's parser is fixed.

28. (Original) The method of claim 22, wherein said data representation language is extensible markup language (XML).

29. (New) An extensible method for simplifying input requirements for user input provided to a document parser, the method comprising:

receiving a schema for a first extensible markup language (“XML”) grammar level,

wherein the schema conforms to a first document type definition (“DTD”);

performing a first transformation of said schema in accordance with a first stylesheet to generate from said schema a second DTD relating to interpretation of said first grammar level;

performing a second transformation of said schema in accordance with a second stylesheet to generate a third stylesheet for said first grammar level;

obtaining a user defined input in said first grammar level, said user defined input conforming to said first DTD and said second DTD; and

applying said second DTD and said third stylesheet to said user defined input to generate an output in a second grammar level that conforms to a third DTD used by the parser.
